

The way in which the user interacts with EVA is 2 fold.

First is via voice. Eva listens for the user to say the wake word ("EVA") and then the Microphone picks up the command from the user. The software utilized google speech API to make text from the audio file and then respond accordingly.

The other way the user interacts with the device is via touch. For the sake of the EXPO, this is the route we chose because of the expo environment. There was a home screen with buttons and then Each of those buttons took the user to a different screen.
